EVAPORATOR COIL SAFETY

Recognize this symbol as a safety precaution.

Recognize Safety Symbols, Words and Labels

The following symbols and labels are used throughout this manual to indicate immediate or potential hazards. It is the owner’s responsibility to read and comply with all safety information and instructions accompanying these symbols. Failure to heed safety information increases the risk of serious personal injury or death, property damage and/or product damage.

WARNING

Hazards or unsafe practices could result in property damage, product damage, severe personal injury or death.

CAUTION

Hazards or unsafe practices may result in property damage, product damage, personal injury or death.

IMPORTANT:

Installation and repair of this unit should be performed ONLY by individuals meeting the requirements of an “Entry Level Technician” as specified by the Air-Conditioning, Heating and Refrigeration Institute (AHRI). Attempting to install or repair this unit without such background may result in product damage, personal injury or death.

WARNING

HIGH VOLTAGE!

Disconnect ALL power before servicing.
Multiple power sources may be present.
Failure to do so may cause property damage, personal injury or death.

INSTALLATION REQUIREMENTS

These instructions are intended as a general guide only for use by qualified persons and do not supersede any national or local codes and regulations in any way. Compliance with all local, state, or national codes and regulations pertaining to this type of equipment should be determined prior to installation.

Read this entire instruction manual, as well as the instructions supplied in separate equipment, before starting the installation.

All models are designed for indoor installation only.
Install the conditioned air plenum, ducts and air filters (not provided) in accordance with NFPA 90B Standard for the Installation of Warm Air Heating and Air-Conditioning Systems (latest edition).
Air filters (not provided) must be listed as Class 2 furnace air filters.
**Tools and Parts**

Gather the required tools and parts before starting installation. Read and follow the instructions provided with any tools listed here.

### Tools Needed
- Torch
- Tape measure
- Flat-blade screwdriver
- ¼” nut driver
- ¾” open end wrench
- Level

### Parts Needed
Check local codes. Check the existing drain configuration before purchasing parts.
- Field-fabricated auxiliary drain pan (in some installations)
- Evaporator coil may be provided as a separate coil or mounted in a duct extension.

### System Requirements

**IMPORTANT:**
- The blower and duct system must be properly sized in order to provide adequate cooling and heating performance. For proper cooling operation, the airflow through the indoor coil should be 350 to 450 CFM per ton of cooling capacity (or 350 to 450 CFM per 12,000 Btu/h) based on the rating of the outdoor unit.
- All air passing over the evaporator coil must be filtered.
- Evaporator coils are matched to specific outdoor units to obtain an ARI rating. The orifice installed on each evaporator coil is chosen for the Btu/h capacity of the coil. The factory-installed orifice size is stamped on the orifice body, and is identified with a label on the orifice extension stub. The orifice size must match the size called for on the refrigerant charging table found on the outdoor unit. A selection of replacement orifices is available from the distributor.

**NOTE:**
- All vertical mount models come from the factory with right front drain connections.
- Multiposition models come from the factory with right and left front drain connections for vertical installations and left front drain connections when installed in the horizontal position.
- Minimum ¾” copper or PVC drain lines are recommended.

**CAUTION**
- If secondary drain is not installed, the secondary access must be plugged.

### Drain Requirements

- A field-fabricated auxiliary drain pan, with a drainpipe to the outside of the building, is required in all installations over a finished living space or in any area that may be damaged by overflow from the main drain pan. In some localities, local codes may require an auxiliary drain pan for any horizontal installation.

### INSTALLATION INSTRUCTIONS

#### Inspect Shipment
- Check the evaporator coil rating plate to confirm specifications are as ordered.
- Upon receipt of equipment, inspect it for possible shipping damage. Examine the evaporator coil inside the carton if the carton is damaged.
- If damage is found, it should be noted on the carrier's freight bill. Damage claims should be filed with the carrier immediately. Claims of shortages should be filed with the seller within 5 days.

**NOTE:** If any damages are discovered and reported to the carrier, do not install the evaporator coil, because your claim may be denied.

#### Install Horizontal Evaporator Coil

**IMPORTANT:**
- The evaporator coil must be installed upstream in the discharge (supply) air of a gas unit. This is a bi-directional coil and can be installed in either the left or right direction. Determine the coil direction by the side that allows the best access.
- Do not install an evaporator coil in the return air, or excessive condensation will occur within the unit.
- If the unit and coil are not similar in depth and width, a field-supplied transition can be used to center the unit and coil openings. Use an attachment bracket (Z-bracket) (provided) to attach the coil to a narrower unit when the unit is one size smaller than the coil. For example, if the coil height is 17½” (44.5 cm), then the unit width would be 14” (35.6 cm).
- To reverse from right to left application, relocate the front rail to the back, and the back rail to the front. Then attach flanges to the discharge side of the unit.

### Location Requirements

When the evaporator coil is installed in an attic, above a finished ceiling, or in any location where condensate overflow would result in property damage, the installer must provide an auxiliary drain pan in addition to the primary and secondary drains. The auxiliary drain pan must be connected to a drainage system separate from the primary condensate drain.

Install this coil upstream (discharge air) of the furnace. This coil is bi-directional coil and can be installed in either the left or right direction. The coil is factory shipped for right side application. Determine the coil direction by the side that allows the best access.

### Right Application
![Diagram of right application](image1)

### Left Application
![Diagram of left application](image2)

To reverse from right to left application, relocate the front rail to the back, and the back rail to the front. Then attach flanges to the discharge side of the unit.
Attach the Duct Flange—Horizontal Right Application

- Remove the shipping bracket spanning the A-Coil apex from the rear of the wrapper on all models prior to installation.
- Loosen the flange fastener and pull the flange forward. Retighten.
- The bottom duct flange for the supply plenum side is shipped unattached. Insert the flange into the bottom rail and use a \( \frac{5}{16} \)" screw to attach at the middle of the flange.
- Attach the coil to the furnace using the hardware and brackets provided. See the "Installation of Furnace, Coil and Plenum" illustration.
- Attach plenum to coil. See the "Installation of Furnace, Coil and Plenum" illustration.
- Use tape or mastic to seal between the coil and furnace, and between the coil and plenum.

Installation of Furnace, Coil and Plenum

Plastic Drain Pan

**WARNING**

Do not use the coil pan that shipped with the unit on an OIL furnace or any application where the temperature of the drain pan may exceed 300°F (149°C). A high temperature drain pan (Kit Numbers HTP-A, -B, -C and -D for nominal widths of 14", 17½", 21" and 24½" [35.6, 44.5, 53.3 and 62.2 cm] respectively) should be used for this type of application. A field fabricated metal drain pan can also be used.

The drain pan has a primary and an optional secondary drain with \( \frac{3}{4} \)" NPT female connections. The connectors required can be \( \frac{3}{4} \)" NPT male PVC or metal pipe and should be hand tightened to a torque of approximately 37 in/lbs to avoid damage to the drain pan connection. An insertion depth between 0.355" to 0.485" (0.9 cm to 1.2 cm) (3 to 5 turns) should be expected at this torque. If the secondary drain line is required, it must be run separately from the primary drain and should end where it is easily seen. Water coming from this line means the coil primary drain is plugged and needs clearing.

A trap must be installed in the drain line below the bottom of the drain pan. If a copper drain line is used, solder a short piece of pipe to the connector before installing a drain fitting.

**NOTE:** Do not over-torque the \( \frac{3}{4} \)" copper connector to the plastic drain connection.

When completing the drain line, use a wet rag or heat sink material on the short piece of pipe to avoid damage to the plastic drain pan.

![Diagram of Condensate Drain Connection](image2)

A. Air handler
B. Drain connection
C. Positive liquid seal required at trap

A drain trap in a draw-through application keeps air from drawing back through the drain line during fan operation which keeps the condensate from draining. If the drain line is connected to a sewer line, a drain trap keeps sewer gases from drawing into the airstream during blower operation. In a blow-through application, the drain trap keeps conditioned air from escaping. It is permissible in this application to use a shallow trap design sometimes referred to as a running trap.

Field experience has shown that condensate drain traps with an open vertical Tee between the air handler and the condensate drain trap can improve condensate drainage in some applications, but may cause excessive air discharge out of the open Tee. This type of drain is not recommended due to the resulting air leakage.

Regardless of the condensate drain design used, it is the installer’s responsibility to ensure the condensate drain system is of sufficient design to ensure proper condensate removal from the coil drain pan.

Condensate Drain Connection—Running Drain

**NOTE:** Connect drain should be the same size or larger than what is on the unit.
Verify Orifice Size

IMPORTANT: The proper orifice size is dependent on indoor coil/outdoor unit combination and application. Consult the outdoor unit information to determine if the indoor unit has the correct orifice installed.

Connect Refrigerant Lines

Refrigerant lines must be connected by a licensed, EPA certified refrigerant technician in accordance with established procedures.

IMPORTANT:
- Connecting refrigerant lines must be clean, dehydrated, refrigerant-grade copper lines.
- Evaporator coils should be installed only with specified line sizes for approved system combinations.
- Handle the refrigerant lines gently during the installation process. Sharp bends or possible kinking in the lines will cause a restriction.
- Do not remove the caps from the lines or system connection points until connections are ready to be completed.

Prepare Tubing

- All cut ends are to be round, burr free, and cleaned. Failure to follow this practice increases the chances for refrigerant leaks.
- The suction line is spun closed and requires a pipe cutter to remove the closed end.

Post Brazing

- Cool all welded joints with water or a wet rag.

Piping Size

For the correct tubing size, follow the specification for the condenser/heat pump.

WARNING

This product is factory-shipped under pressure. Follow these instructions to prevent injury.

Check Orifice and Connect Tubing

1. Loosen the \(\frac{13}{16}\)" nut one turn only.
   
   NOTE: No pressure loss indicates a possible leak.

2. Remove the nut and discard the plastic or brass cap.

3. Remove the check piston to verify it is correct, and then replace the piston. See piston kit chart in instructions.

4. Use a tube cutter to remove the spin closure on the suction line.

5. Remove the tailpiece clamped to the exterior.

6. Slide the \(\frac{13}{16}\)" nut into position on the tailpiece.

7. Braze the tailpiece to the liquid tube.

8. Insert the suction line into the connection.

9. Slide the insulation and the rubber grommet at least 18" (45.7 cm) away from the braze joint.

10. Braze the suction line.

11. After the tailpiece has cooled, verify the position of the white Teflon® seal and hand tighten the nut.

12. Torque the \(\frac{13}{16}\)" nut to 20 to 30 ft-lbs. (2.77 to 4.15 m-kg).

13. Replace the suction line grommet and insulation.

CAUTION

To protect the unit when welding close to the painted surfaces, the use of a quenching cloth is strongly advised to prevent scorching or marring of the equipment finish. Solder with a minimum of 5% silver is recommended.

ASSISTANCE OR SERVICE

If you need further assistance, you can write to the below address with any questions or concerns:

Whirlpool® Home Cooling and Heating
14610 Breakers Drive
Jacksonville, FL 32258

Please include a daytime phone number in your correspondence.

Accessories

To order accessories, contact your Whirlpool® Home Cooling and Heating dealer.
